Questions, Comments, Concerns

Hello, Mr Romano,
I am writing to you because I have noticed that our water quality has been very poor due to intoxication and climate. So, I humbly request the select board to make our water quality great. What I noticed has been happening is that the salt marshes have been vanishing and the vegetation has turned grey and black. Those who are affected by this issue are the public, economy, and municipal infrastructure. This is important to fairhaven because it directly impacts the marine environment's way of life. The selectboard should care about this issue because they directly threaten municipal infrastructure, public health, and financial stability. Something that I have observed as I walk along the west island is that the vegetation is very dark. The saltwater restoration project was a town run project that would try to mitigate these effects. Statistically I've also learned that the USGS said that we've lost %20 of salt marshes over an 18 year period. What I think should be done is we need to facilitate salt marsh migration space and implement advanced restoration and drainage techniques. The people who would benefit would be homeland and inland homeowners, fairhaven taxpayers, and more. It would benefit the community by having enhanced flood control and protection, improved water quality and more. The problems it would help solve are environmental, structural, and public health problems. This idea is realistic because it results in economic justification and a high success rate of practical interventions.
Thank you for your time and I hope that as a community we can solve this issue!

Thanks again,
Liam Donly
